

Abstract

Bachelor thesis on Psychomotor development of preschool children with hearing impairment – possibilities of physiotherapeutic intervention is processed in the form of case study research.

The work is divided into three parts. The first part contains basic information about a hearing impairment and an introduction into specifics of education and psychomotor development of a preschool child.

The main part of the work is concentrated on sensorimotor deficits that are connected to hearing impairment of children. A lot of studies concerning this topic are comprised in this part.

The third, practical, part contains a case study of two children – one healthy and one with a perceptual hearing defect. Based on the mentioned studies an examination with later comparison of sensorimotor functions of both children was performed.
